

This figure displays a large-scale protein-protein interaction network. The nodes, representing individual proteins, are color-coded based on their functional clusters or domains. The network is highly interconnected, with numerous edges linking different protein groups. Key clusters include a blue/purple group at the top left, a green/yellow group at the middle right, a red/orange group at the bottom right, a cyan/light blue group at the bottom left, and a pink/magenta group at the bottom center. The overall structure suggests a complex web of biological processes and pathways.
